Instructions

After extracting the zip file, inside the folder entitled Final_Product you will find 4 files. In order to "install" the database on your computer you will have 2 options. The first one is to simply open a terminal or command line and opening mysql. Create a database named Airbnb or something else using the command "CREATE DATABASE mysql; for example.

After this you can use the dump file airbnb.sql. To use this file, run this on a terminal 'mysql airbnb < airbnb.sql'. After this your new database will have all the contents of my airbnb database.

If this way is not convenient for you there are also 2 other files you can use to create the database on your side. There are 2 txt rtf files named 'Createdatabasetablescommands' and 'load_csv_files_into_tables_on_terminal_commands'. These 2 files contain the code to create the database and you can simply run them on a terminal mysql window. It should be noted that in the second file you should replace the part that contains the path to the file with your own path to the files inside the csvfilesforinsert folder in order to insert the mock data.

These are the 2 ways you can create my database on your side. There is also additional information about instructions on the presentation file.

After you do this you can try some queries out in order to test the functionalities.
